

How to connect the UPS to the distribution box

AI Overview

To connect a UPS to a distribution box, you need to isolate the circuits to be backed up, wire them through the UPS output, and connect the UPS input to the main supply while following proper safety and wiring standards.

Step-by-Step Connection Process

-

Identify Critical Circuits: Determine which rooms or devices require uninterrupted power. Only these circuits will be connected to the UPS output .

-

Disconnect Live Wires: Turn off the main power and disconnect the live (phase) wires of the selected circuits from the main distribution board. This ensures that only the UPS will supply power to these circuits during an outage .

-

Install Dedicated MCBs: Connect the selected circuits to the UPS output via separate single-pole MCBs. These MCBs will protect the circuits and allow the UPS to supply continuous power .

-

Connect UPS Input: Plug the UPS input into the main supply through a dedicated outlet or connect it to the outgoing terminals of the main double-pole MCB. This allows the UPS to charge its batteries while the main power is available .
