

# How to connect the new communication optical cable binding wire

## AI Overview

To connect a new optical cable, carefully strip, clean, and align the fiber ends, attach the appropriate connectors, and secure the cable using binding wire without exceeding bend or tension limits.

### Step 1: Prepare the Cable

- Inspect the cable for any physical damage before installation and ensure the protective material remains in place until ready to work with it .
- Strip the outer jacket using a fiber optic stripper to expose the inner glass fibers, taking care not to damage the core .
- Clean the fiber with isopropyl alcohol and lint-free swabs to remove dust or oils .

### Step 2: Cleave and Connect the Fiber

- Cleave the fiber using a precision cleaver to create a perpendicular, defect-free end face, which is critical for optimal signal transmission .
- Attach the connector (LC, SC, ST, or TOSLINK depending on your system) by aligning the fiber with the ferrule and securing it with adhesive or a fixture .
- Test the connection using an optical power meter or OTDR to ensure proper signal strength and alignment .

### Step 3: Secure the Cable with Binding Wire

- Plan the cable route to avoid sharp bends, edges, or high-pressure points .
