

How to disconnect the power to the elevator machine room electrical distribution box

Overview

2 (Safety Code for Elevators and Escalators) and the NEC 620. 51(B) require power to an elevator be shut down prior to the release of water in the elevator shaft or machine room. This is typically accomplished by a shunt-trip device. 51 provides rules related to the disconnecting means for elevator equipment. In the OESC. A look at Article 620. I believe there is a requirement for proximity to the door. Is there not?

Has this changed OR should I be looking in the, in this case MA, elevator code for. Working on or near energized circuits poses a serious risk of electrical shock. In some instances the Bureau has observed that disconnecting means have been installed in. Overcurrent devices and disconnects must be located in machine or control spaces, be lockable and provide a single means to disconnect ungrounded conductors, with selective coordination for multi-elevator feeders. Conductor and wireway fill, approved flexible traveling cables and secure supports.
