

How to get the incoming line into the distribution box

AI Overview

To press or connect the incoming line into a distribution box, strip the wires, match the correct color-coded terminals, secure them firmly, and ensure proper grounding and safety checks.

Step 1: Safety First

Before starting, turn off the main power supply and verify with a voltage tester that no electricity is flowing. Place a “Do Not Switch On” sign to prevent accidental energizing of the circuit ().

Step 2: Prepare the Incoming Line

- Strip the insulation from the ends of the incoming wires to the correct length so that the exposed copper fits snugly into the terminals without overhang ().
- Identify each wire according to standard color codes: Phase lines (A, B, C) typically yellow, green, and red; Neutral in blue; Ground in yellow-green stripes ().

Step 3: Connect to the Distribution Box

- Insert each wire into its corresponding terminal on the main circuit breaker or busbar. Ensure phase wires go to the input terminals of the MCBs, neutral to the neutral bus, and ground to the grounding bar ().
- Tighten the terminal screws firmly but avoid over-torquing, which can damage the contacts ().
- Use crimp sleeves or terminal blocks if necessary to secure the wire ends.
