

How to handle excess special optical cables

AI Overview

Excess optical cables should be stored in a dry, UV-protected environment, coiled properly, and handled with care to prevent mechanical damage and contamination.

Safe Handling Practices

- **Personal Protection:** Always wear safety glasses, gloves, and protective clothing when handling optical fibers to prevent injury from sharp glass shards or chemical residues (e.g., epoxies or solvents) in the cables .
- **Avoid Mechanical Stress:** Do not bend cables beyond their minimum bending radius, avoid kinks, knots, or crushing, and never place heavy objects on stored cables .
- **Connector Protection:** Keep dust caps on connectors until ready to use, and clean ferrules before connecting to prevent contamination and signal loss .

Storage Guidelines

- **Indoor Storage:** Store cables indoors in a dry, UV-protected area. Outdoor storage can expose cables to weather, UV radiation, and moisture, which may degrade performance .
- **Drum Positioning:** Store cable drums vertically rather than on their sides to prevent loosening of the winding and potential hidden damage .
- **Temperature and Humidity:** Follow the manufacturer's specifications for storage temperature and relative humidity, typically keeping indoor cables below 60% humidity .
