

# How to wire the distribution box system frame

## AI Overview

Wiring a distribution box with a frame involves securely mounting the box, connecting the main power, installing circuit breakers, wiring outgoing circuits, grounding, and performing safety checks.

### Step 1: Preparation and Safety

Before starting, turn off the main power supply to prevent electric shock. Gather all necessary tools and materials, including screwdrivers, wire strippers, multimeter, circuit breakers, and appropriately rated wires. Ensure the installation site is dry, accessible, and free from obstructions, ideally at a height of around 1.5 meters for easy maintenance.

### Step 2: Mounting the Distribution Box

Secure the distribution box frame to the wall using expansion bolts or screws. Make sure the box is level, stable, and firmly fixed to prevent movement or vibration. Leave enough space around the box for wiring and heat dissipation.

### Step 3: Installing Circuit Breakers

Place the circuit breakers in their designated slots on the DIN rail or frame inside the box. Each breaker should correspond to a specific circuit in the building. Ensure the breakers are compatible with the load and voltage requirements.

### Step 4: Connecting the Main Power
