

# Inspection of UK Lighting Distribution Boxes

## AI Overview

Inspection of UK lighting distribution boxes requires a structured approach under live or de-energised conditions, following HSE guidance, BS 7671 standards, and risk-assessed procedures.

### Scope and Components

Lighting distribution boxes, also referred to as LV distribution boards, typically include phase, neutral, and earth busbars, an incoming transformer isolator, and multiple outgoing ways with fuses. Outdoor equivalents are called pillars, housed in earthed metal cases, while indoor units are floor- or wall-mounted. Modern boards often feature enclosed live parts, reducing hazards compared to older open-construction units from before the 1980s .

### Safety and Risk Assessment

Inspections must be preceded by a Point of Work Risk Assessment (POWRA), documenting hazards and mitigation measures. Inspectors should be trained and authorised, using 1000V rubber gloves, full-face visors, and non-contact tools like infrared thermometers or thermal imaging cameras to detect hot spots or poor connections . Rubber mats should be checked for size, condition, and trip hazards.

### Inspection Procedure

Key steps include:

## Article Content

Inspection of LV Distribution Boards, Pillars and Transformer take off ...

LV distribution boards, pillars and cabinets are hazardous and should be treated with great respect. The greater hazard is with older

Distribution board

A distribution board (also known as panelboard, circuit breaker panel, breaker panel, circuit breaker, electric panel, fuse box or DB
