

Ladder-type cable tray service

AI Overview

Ladder-type cable trays provide robust support, ventilation, and easy access for electrical and instrumentation cables in industrial and commercial installations.

Overview

Ladder-type cable trays are designed to support insulated electrical cables over long horizontal or vertical runs. They consist of two longitudinal side rails connected by evenly spaced rungs, resembling a ladder, which allows cables to be securely fastened while maintaining airflow and preventing overheating. These trays are commonly made from steel, aluminum, or fiberglass-reinforced plastic (FRP), and are available in various finishes to suit environmental conditions.

Applications

Ladder trays are widely used in data centers, petrochemical plants, refineries, thermal power stations, and commercial buildings. They are ideal for large power cables and instrumentation wiring, especially where long cable runs are required overhead or along walls. Their open design allows for easy cable installation, inspection, and maintenance, reducing downtime and facilitating future expansions.

Installation and Support

Proper installation is critical for safety and performance. Ladder trays can be mounted on floors, walls, ceilings, or equipment racks using brackets, J-bolts, or other support hardware. The load class of the tray, which defines its weight-carrying capacity over a specific span, must be considered to prevent sagging or structural failure. Installation should follow BS EN 61537 standards and be performed by competent personnel familiar with electrical safety and wiring practices.
