

No malfunction is a requirement for relay protection

Overview

Precision and reliability are crucial to protect relay systems that avoid equipment failure or malfunction during emergencies, this would lead to the destruction of the equipment, power outages, as well as safety risks. Selectivity is a mandatory requirement for all protection, but the importance of it depends on the application. 4 Remedial Action Schemes (RAS). This standard establishes a common reproducible basis for designing and evaluating relays and relay systems. The functional requirements of the relay: The most important requisite of the protective relay is reliability since they supervise the circuit for a. Continued application of a Relay with reduced performance may result in insulation failure between circuits or in burning in the Relay itself. It functions as a watchdog by constantly surveying multiple system components including voltage, current, frequency, and phase angle.
