

Qatar Fiber Optic Cable Joint Construction

AI Overview

Qatar is actively expanding its fiber optic infrastructure through major EPCIC projects, including subsea and underground cable installations connecting key industrial and energy sites.

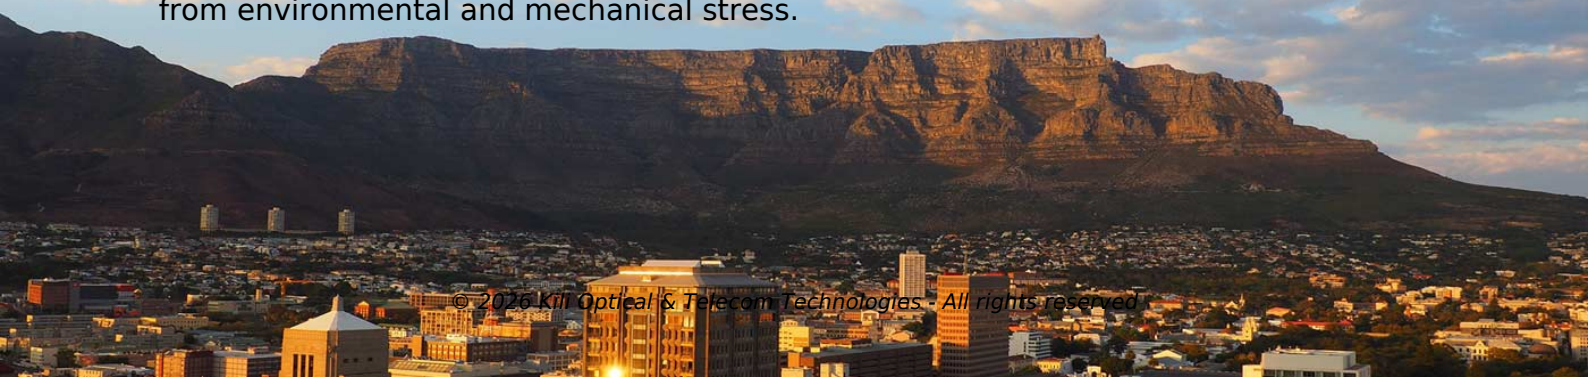

Key Projects and Contractors

New Fibre Link Project: Milaha's subsidiary, Halul Offshore Services, secured an EPCIC contract worth over QAR262 million (\$70 million) to construct a 140-km fiber optic cable system connecting Al Kabaan, Ras Laffan, and the Al-Shaheen oil field. The project involves specialized subsea installation, cable burial, and integration with existing platform assets to enhance connectivity in the energy sector (Milaha) .

Halul Offshore Umbilical Extension: Qatar Design Consortium (QDC) is managing the design and FEED for extending fiber optic cables from the Ras Laffan Landfall (RLL) to RLIC PAB. This includes two 48-core fiber optic cables along primary and secondary routes, with trenches, PVC ducts, overhead trays, JRC-14 chambers, patch panels, and patch cords to ensure full connectivity from Halul Island to Ras Laffan (QDC) .

Technical Aspects of Fiber Joint Construction

- **Cable Routing:** Fiber optic cables are routed through subsea bridges, underground trenches, or micro-tunnels depending on the terrain and project requirements.
- **Joining and Splicing:** Fiber optic joints are created using fusion splicing or mechanical splicing to connect cable segments, ensuring minimal signal loss. Protective enclosures and chambers, such as JRC-14, are used to safeguard joints from environmental and mechanical stress.
