

The fiber optic cable industry will be the first to benefit

Overview

Fiber optic vendors are employing a mix of manufacturing expansion, technological innovation in high-density and next-generation fibers, and strategic supply chain alignment to meet the anticipated surge in demand from AI and data centers in 2026. Optical fiber is superior to traditional copper cables in a multitude of ways, including nearly unlimited bandwidth, improved durability, and being virtually future-proof, and Corning has played a leading role making it easier and more cost-effective to deploy. “We've helped customers make fiber. Taken for granted in many circles, fiber is the backbone of America's broadband technology ecosystem, enabling AI in data centers, cable and cellular networks, and yes, even satellite communications. As demand for bandwidth accelerates, deployment techniques, technology, and policies are evolving rapidly. In 2025, AI-driven data centre investment rapidly emerged as the strongest driver of growth, while traditional telecom demand softened in several markets. Supply dynamics are also changing as Chinese exports dominance. The fibre optic and telecommunications industries continue to face significant workforce and environmental challenges, particularly in the deployment of new infrastructure, securing permitting from utility poles, and finding new technicians and field trades. Inconsistent state environmental. There is an ongoing debate about the existence and magnitude of economic benefits that would be realized if fiber was deployed to locations that are already served by high-speed broadband, but do not have fiber broadband.
