

Three-core cable distribution box

AI Overview

A three-core cable distribution box safely distributes three-phase electrical power from a main supply to multiple circuits, using three-core cables for efficient and balanced load management.

Overview

A three-core cable contains three individually insulated conductors within a single outer sheath, typically used for three-phase power distribution. Each core carries one phase of electricity, making it ideal for industrial, commercial, and high-demand applications. The conductors are usually made of copper or aluminum, and the insulation is often XLPE (Cross-Linked Polyethylene), providing excellent thermal and dielectric properties, mechanical protection, and resistance to moisture and chemicals. A distribution box (DB box), also known as a distribution board, acts as the central hub for electrical circuits. In a three-phase system, the DB box connects the three live wires and a neutral wire to multiple circuit breakers, ensuring safe and balanced power distribution across all connected loads. It typically includes a main switch, individual circuit breakers, and protective devices like RCCBs or RCBOs to prevent overloads, short circuits, and electrical faults.

Key Features

- **Efficient Power Distribution:** Three-core cables allow balanced three-phase load transfer, reducing power losses and improving system stability.
- **Compact and Easy Installation:** Bundling all three phases in one cable simplifies routing and reduces space requirements.
