

USB Fibre Channel Card

AI Overview

A USB to Fibre Channel card (or USB to fiber-optic converter) allows a USB device to connect to a fiber optic network, providing secure, long-distance, and interference-free data transmission.

Overview

USB to Fibre Channel cards, often called USB to fiber-optic converters, convert electrical signals from a USB device into optical signals that can travel over fiber optic cables. At the receiving end, the optical signal is converted back into an electrical signal for connection to another USB device or network switch. This enables highly secure and reliable network connections, especially in environments prone to electromagnetic interference or requiring long-distance data transmission .

Key Features

- **USB Compatibility:** Supports USB 2.0 or USB 3.0 ports, depending on the model, and works with Windows, Mac, and Linux operating systems .
- **Fiber Connectivity:** Uses SC or SFP fiber transceivers, supporting multi-mode or single-mode fiber for distances up to 2 km or more .
- **Plug and Play:** Many converters are powered directly from the USB port, making them portable and easy to deploy without external power .
- **Network Security:** Fiber-to-the-desk (FTTD) connectivity reduces the risk of data leaks and protects against electronic interference common in copper networks .
- **Performance:** Typical USB 2.0 converters provide 100 Mbps Ethernet over fiber, while USB 3.0 models can support higher speeds depending on the SFP module used .
