

Workshop Substation Relay Protection

Overview

Our Substation Relay Protection Training is a 12-hour, instructor-led live online course designed for utility and industrial professionals involved in protective relay design, installation, testing, or maintenance. Relay protection is essential to ensure the stability, reliability, and safety of electrical power systems. Effective relay protection depends on. Generator protection covers: phase-to-phase short circuits in stator windings, stator ground faults, inter-turn short circuits in stator windings, external short circuits, symmetrical overload, stator overvoltage, single- and double-point grounding in the excitation circuit, and loss of excitation. Numerical relays are based on the use of microprocessors. A big difference between conventional electromechanical and static relays is how the relays are wired. It can share data with up to four TiDL relays. This course is ideal for electrical engineers, substation technicians, and system. Relays are protective devices that monitor electrical parameters and initiate responsive actions to inputs that safeguard personnel and electrical systems.
